10 good reasons to use Startup TOOLS 2012

For more than 10 years now, Startup TOOLS has guaranteed efficient utilisation of the product development environment. The success of Startup TOOLS throughout the world is based on the combination of clever tools, attuned working environments and individual graphical configuration options. There are many reasons to use Startup TOOLS 2012. Here we tell you the first 10:

Parameter manager

Provides comfortable editing of parameter standards (description, drawing number, designer, etc.) of parts, assemblies and drawings. Parameters can be assigned from predefined lists. It is even possible to assign parameter values in multiple languages. This makes classification of your elements an easy task.

Number generator

Creates unique filenames for parts, assemblies or other Pro/ENGINEER items. The generator is configurable to meet company standards.

Library viewer

Provides a convenient way to open, copy, insert and copy insert objects from the standard library. Previews can be created via double-click. In addition to previews it is possible to deposit PDF or HTML help files.

MS-Excel BOM inteface

Allows non-associative import of BOM reports or any other tables contained in a drawing into MS-EXCEL.

SmartLibrary Lite & SmartMenu Lite

SmartLibrary offers bolt and dowel pin connections via an interactive user interface. SmartMenu enhances the right mouse menu with many useful Crep Parametric commands.

Multi dimension editing

This auxiliary application allows quick modification of all dimensions and dimension symbols of a feature, part, assembly, subpart of an assembly in a single stroke. This enhances overview and reduces the effort for modifications dramatically.

Creo app configuration

Easily manage installation and configuration of the main Creo apps. Choose the app needed with the necessary configuration from a single UI. Configure apps like Creo Parametric, Creo Direct and Creo Simulate easily.

Creo Parametric, Creo Direct, Creo Simulate working environment

Contains all configurations, objects and tools to instantly get productive. All elements are synchronised and are available after the installation as a basis for your own customised working environment.

Model configuration

The Model User Interface (MUI) provides semi-automation of parts and assemblies variants, comparable to working with a construction kit. A web based user interface is generated, which allows you to control parts and assemblies. The MUI is editable at all times.

Central administration of the product development environment

Central storage of all configuration settings and objects as well as the possibility to graphically configure diverse working environments ensures support for all user requirements of a Creo Parametric, Creo Direct and Creo Simulate workplace (including Pro/INTRALINK, PDMLink). The working environment can be adapted to any company requirements such as language, plot environment, installation standards, license and software availability. Client specific working environments (e.g. Caterpillar, Volkswagen, BMW, etc.) can be included and made available at any workstation.
